

Daglengden ved ekvator

Det er alltid 12 timer med dagslys ved ekvator, det endrer seg aldri.

Det er bare 12 timer dagslys midtsommer og midtvinter.

Daglengden ved ekvator endrer seg mye med sesongene.

Daglengden endrer seg litt med sesongene, selv ved ekvator.

?

The diagram features a central illustration of the Earth with a red arrow pointing to the equator. Above the Earth is a bright yellow sun with rays. Five people are shown around the Earth, each with a speech bubble. The people include a woman with dark hair in a ponytail, a young man with spiky brown hair, a young man with short black hair, a woman in a red hijab, and a woman in a wheelchair with short brown hair. The speech bubbles contain text in Norwegian discussing the length of day at the equator.
